

Mock systems, not a galaxy and not data: 32 tracer orbits in a softened point mass (A), 32 self-gravitating bodies (B), three point masses (C). Every Fisher matrix is J^T C^-1 J at one point; no fit was run.
The reference is the float64 jacfwd Jacobian; jacfwd and jacrev agree to <= 2.6e-14. All spectra are squared singular values of the whitened Jacobian, computed in float64 for every method so that only the Jacobian differs.
Defaults: sqrt(eps), eps^(1/3), eps^(1/5) times the scale, fixed before the sweep. Float32 steps below 1e-7 round to zero (x + h == x) and are not drawn. Arm B: median and range over seeds 1-3.
